P2 Solar Launches Breakthrough R&D Initiative in Biological CO_2 Capture

Vancouver, BC – September 4, 2025 – P2 Solar, Inc. ("P2" or the "Company") (OTC: PTOS), a renewable energy company focused on distributed solar and innovative carbon reduction technologies, today announced the launch of a new research and development initiative aimed at capturing atmospheric carbon dioxide (CO_2) using engineered bacteria.
This initiative leverages P2's renewable energy expertise to power a scalable biological system where microbes capture CO_2 and convert it into valuable products such as fuels or chemicals. The approach provides a lower-cost, carbon-negative alternative to conventional capture technologies.

P2 will fund and develop a laboratory-scale prototype within the next 12 months. The company's roadmap includes advancing to a pilot plant in Phase 2, followed by a commercial licensing model for widespread deployment.

"Carbon capture is one of the defining challenges of our time. By combining solar power with cutting-edge biotechnology, we aim to turn carbon emissions into profitable resources while helping address climate change," said Raj-Mohinder Gurm , CEO of P2 Solar.

This initiative complements P2's growing rooftop solar business, offering investors exposure to both proven renewable energy installations and high-upside R&D.

About P2 Solar, Inc.

P2 Solar, Inc. (OTC: [Insert Ticker]) is a renewable energy company advancing clean energy solutions through its rooftop solar subsidiary, Futricity Solar, and pioneering carbon-negative technologies. The company's dual approach offers investors both stable growth from solar EPC projects and breakthrough opportunities in biological CO_2 capture.
